

To whom it may concern

I am writing to recommend Sina Heydari for admission to your PhD program. I have known him for over three years since he started the master degree in the Institute of Advance Studies in Basic Sciences (IASBS). Also, I was his instructor in several advanced courses that are mathematically and computationally demanding. This sustained academic interaction has enabled me to evaluate Sina for doctoral-level research with a high degree of confidence.

During his study, Sina took several graduate courses: “Bioinformatics”, “Feature Selection and Extraction” and “Artificial Neural Networks” with me, all of which require strong foundations in linear algebra, optimization, and statistical learning and he was one of the best students in my very demanding classes. His strongest performance was in Artificial Neural Networks, where he implemented a Self-Organizing Map for clustering and visualization in MATLAB, accompanied by a clear and well-structured analytical discussion of the results. Across these courses, his work showed a clear progression toward depth, rigor, and research-oriented thinking.

Sina further distinguished himself through research-driven extracurricular work conducted under my direct supervision. He was a member of our department’s team at the National Exhibition of Research and Technology Achievements for two consecutive years (2024 - 2025), and he designed and implemented an LLM-based Persian poetry contest application in Python, demonstrating early engagement with large language models and an informed treatment of language-specific challenges. In the second year, he developed and presented an LLM-based personality prediction system from text, in addition to an object detection application using YOLOv8. These projects involved genuine problem formulation, informed model selection, evaluation, and the clear communication of technical ideas to non-specialist audiences.

From a doctoral standpoint, Sina’s most notable strength is his capacity for independent inquiry. He is comfortable navigating unfamiliar literature, adopting modern research tools, and refining his approach based on empirical results. His work consistently reflects intellectual curiosity, persistence, and a willingness to engage with open-ended research questions.

For all these reasons, I strongly recommend Sina Heydari for admission to your PhD program in computer science or closely related fields, particularly in machine learning, neural networks, and natural language processing.

Mahdi Vasighi

Assistant professor

Department of Computer Science and Information Technology, Institute for Advanced Studies in Basic Sciences (IASBS), Zanjan 45137-66731, Iran
